

MONITORING PO RIVER WATER EXTENTS ANALYSIS

MUHAMMAD ASAD KHAN

MATRICOLA - 910038

m.khan80@campus.unimib.it

Introduction

- Remote sensing is the process of detecting and monitoring the physical characteristics of an area by measuring its reflected and emitted radiation at a distance (typically from satellite or aircraft).
- This report shows the methodology to calculate and compare water surface areas of the Po River south of Cremona during the Spring-Summer periods of 2022 and 2023 using Sentinel-2 satellite imagery and Google Earth Engine (GEE).

GOOGLE EARTH ENGINE CODE LINK:

<https://code.earthengine.google.com/28b28c318af97f8d229f432151523ea8>

Task 1: Water Surface Area Calculation.

Objective:

To develop a method that estimate the water surface area of the Po River south of Cremona using Sentinel-2 imagery.

Steps Performed:

1. **Define Area of Interest (AOI):** The AOI is defined as a geographic polygon encompassing the region south of Cremona along the Po River.
2. **Select Sentinel-2 Images:** Sentinel-2 images is filtered to select those with less than 20% cloud cover for the periods April 1 to September 30 in 2022 and 2023, to ensure the use of high graphics images.
3. **NDWI Calculation:** The Normalized Difference Water Index (NDWI) is used to identify water bodies. NDWI is calculated using the green (B3) and near infrared (B8) bands of Sentinel-2. The formula for NDWI is:
 - $$\text{NDWI} = (\text{NIR} - \text{Green}) / (\text{NIR} + \text{Green})$$

- 4. Water Threshold Definition:** A threshold value of 0.3 is used to classify pixels as water. Pixels with NDWI values greater than 0.3 is classified as water bodies.
- 5. Water Mask Generation:** For each image, a binary water mask is generated where pixels exceeding the NDWI threshold is mark as water, and others as land.
- 6. Water Pixel Count:** The total number of water pixels is counted for each image within the AOI using a regional reduction operation.
- 7. Water Area Calculation:** The pixel count is multiply by the area of each Sentinel-2 pixel (10m x 10m) to convert the count to actual water surface area.
- 8. Total Water Area:** Water area estimates for each image within the specified period is sum up to obtain the total water surface area for the Spring-Summer periods of 2022 and 2023.

Task 2: Comparative Analysis.

Objective:

To compare the water surface areas calculated for the Spring-Summer periods of 2022 and 2023.

Methodology:

- Calculate Statistics:** Statistical measures are computed, including mean, variance, minimum, maximum, and histogram of the water areas for the periods of interest.
- Visualize Results:** The water area time series for 2022 and 2023 is visualized using bar charts, and a combined line chart was created to facilitate comparison.

The screenshot shows the Google Earth Engine interface. The top navigation bar includes 'Google Earth Engine', a search bar, and a user profile 'fair-circuit-424701-i6'. Below the navigation is a toolbar with 'Scripts', 'Docs', and 'Assets' tabs, followed by buttons for 'New Script', 'Get Link', 'Save', 'Run', 'Reset', 'Apps', and settings. A sidebar on the left lists various Earth Engine modules. The main area contains a script editor with code for visualizing water data from 2022 and 2023. To the right is an 'Inspector' panel displaying statistical data for both years, and a 'Console' panel showing the execution results. At the bottom, there are two map viewers showing regions around Asti and Mantua, with various roads and geographical features labeled.

97725403.7159273

Normalized Histogram of Water Area in 2023

A histogram showing the normalized frequency of water areas in 2023. The x-axis is 'Water Area (Normalized)' ranging from 0 to 100. The y-axis is 'Frequency' ranging from 0 to 7,500. The distribution is highly skewed, with most values between 0 and 50, and several sharp peaks reaching up to 7,500.

Water Area in 2022

A bar chart showing monthly water area in 2022. The x-axis is 'Date' (months Jan to Dec). The y-axis is 'Water Area (m²)' ranging from 0 to 4,000,000. The area is represented by blue bars, showing significant seasonal variation with peaks in summer months like July and August.

RESULTS AND COMPARISON

Overview of Water Extents in 2022

The 2022 saw a significant variation in the water level of the Po River south of Cremona. In MAY the level of water is further increased. However, in JULY we have seen drop water levels.

RESULTS AND COMPARISON

Overview of Water Extents in 2023

The analysis of the Po River's water extents in 2023 has differences compared to 2022.

In MAY it has higher water levels due rainfall and/or snowmelt. These variations show how climate influences affect rivers and emphasize the value of continuous monitoring.

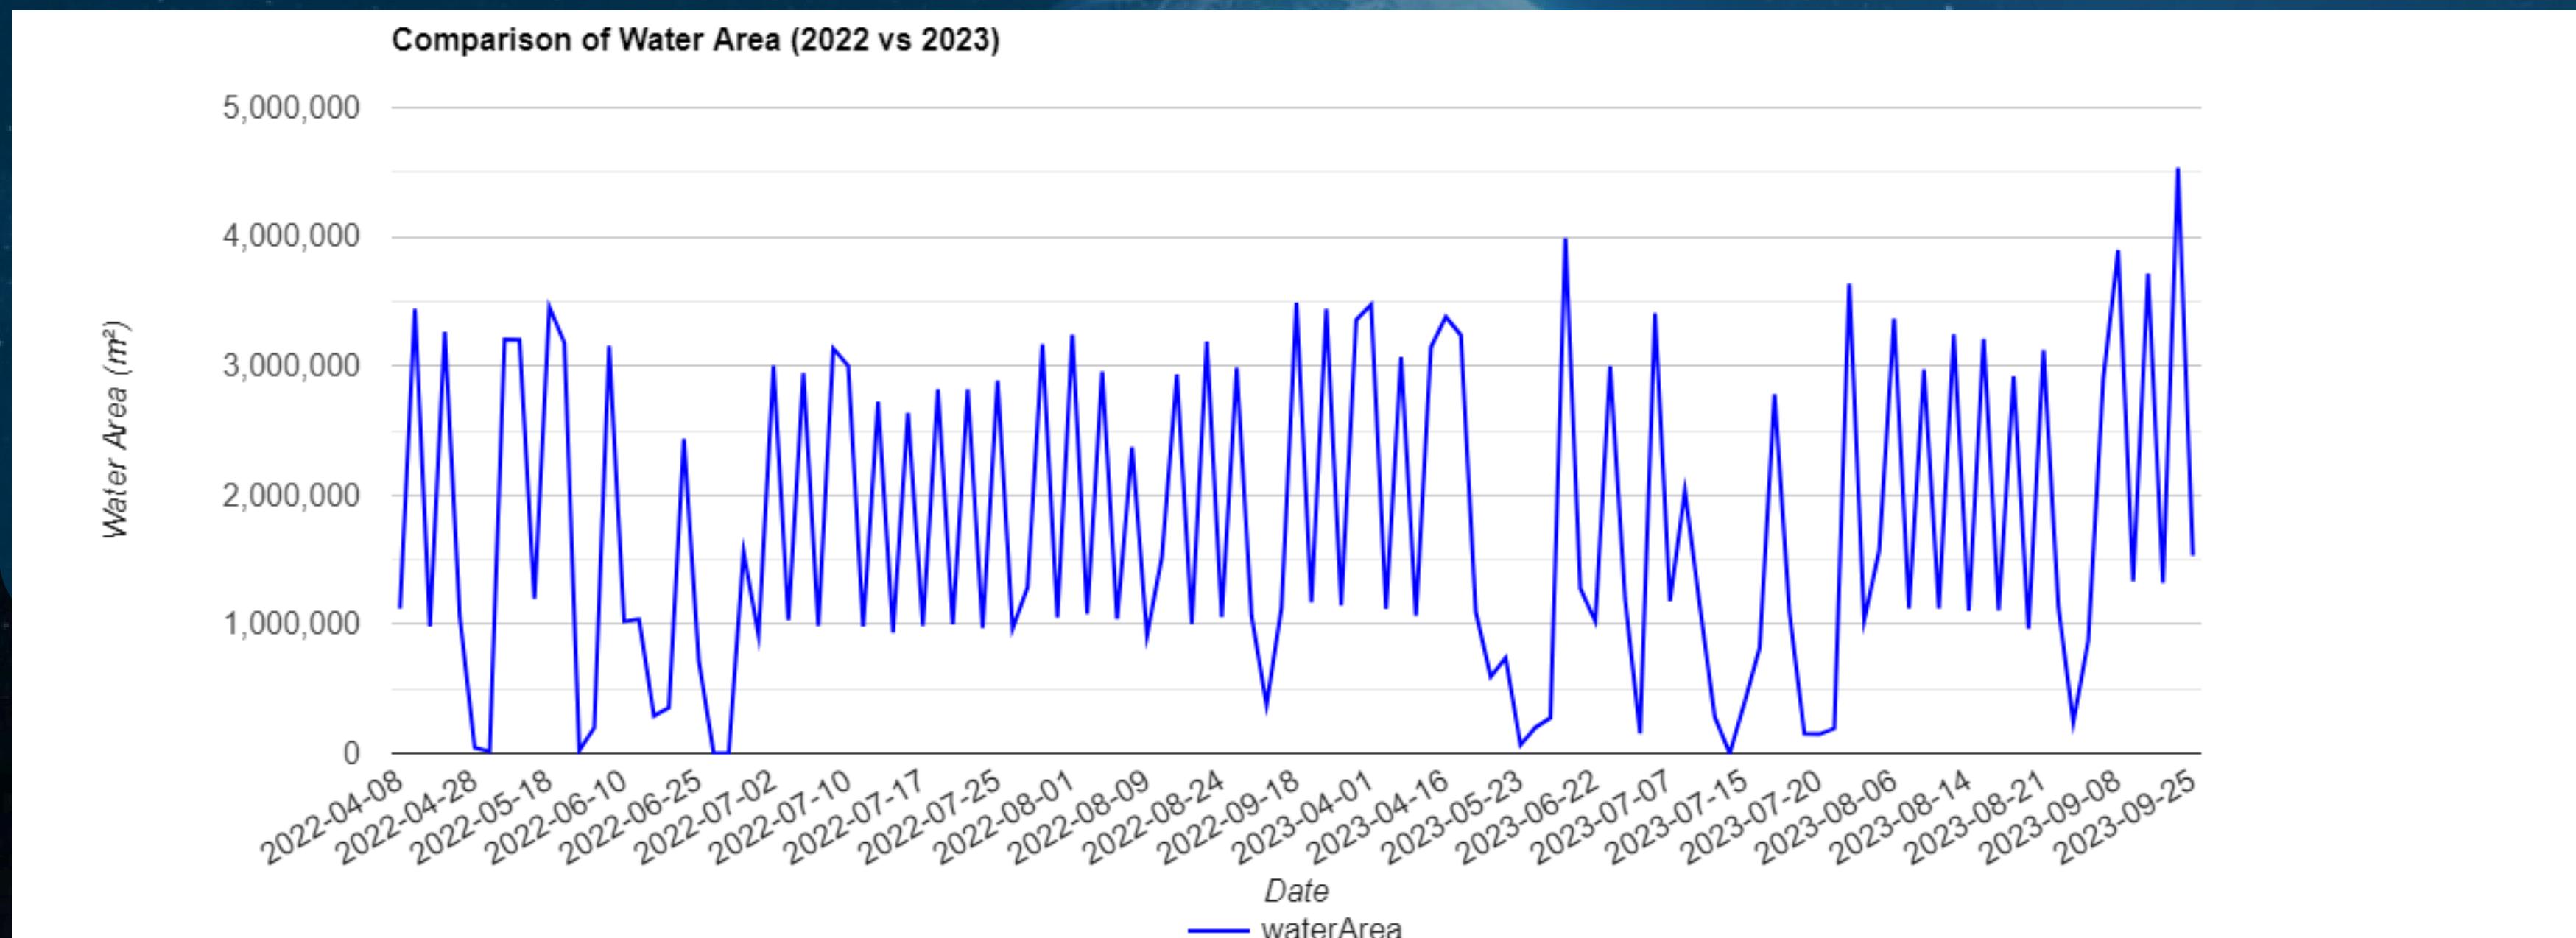

RESULTS AND COMPARISON

2022 vs 2023 Water Extents

The Po River's water extents in 2022 and 2023 are contrasted in this graph. The differences in total water surface levels, as well as changes in maximum and minimum values, are highlighted.

These metrics help in understanding the trends observed in these two years.

CONCLUSION

This research created an effective way to evaluate water resources using Sentinel-2 photos. A comparison between 2022 and 2023 showed that the Po River's water availability may fall, showing the importance of careful water management and observation.
